Physics Physics is the study of matter and its motion through space and time. Basic guidelines for physics The basic guidelines for Physics include the following: The Universe is an eternal, cyclical, and infinite system of existence. Matter and energy are fundamental to our understanding of the universe. The universe is made up of atoms, the building blocks of all matter; atoms combine to form molecules, which form atoms; and atoms combine to form molecules; and so on. Before the Big Bang, the universe was in a state of nearly absolute zero, temperature and pressure. As the Big Bang occurred, space expanded infinitely, and all energy as well as matter was created simultaneously, eventually creating matter (i.e. atoms and molecules) and energy (i.e. electromagnetic radiation). The Big Bang is still ongoing and the universe still expanding. In actuality, the universe is a continuum of matter, a single, homogeneous, and infinite substance which cannot be perceived as being divided into different parts. Only objects that are outside the universe have a definite boundary. Absolute zero is an absolute reference point for temperature. Any temperature is lower than absolute zero. Any 09e8f5149f
